Installation

STEP 1

Mount the sensor on the door frame and the magnet on the door. If the sensor is used on double doors, mount the sensor on the least-used door and the magnet on the most-used door. (If the sensor does not fit on the frame it can be installed on the door with the magnet on the frame.)

STEP 2

Locate the sensor within 100 ft. of the panel. The environment at the installation site can have significant effect on range.

STEP 3

Make sure the arrow on the magnet aligns with the three lines on the sensor with the magnet no more than 0.4 inches from the sensor.

STEP 4

Use the provided adhesive tape to mount the sensor and magnet. (The provided screws can be used on the sensor for a more secure installation.)

STEP 5

Avoid mounting the sensor in areas where they will be exposed to moisture or in an area where a temperature range of 32 to 120F cannot be met.

STEP 6

Avoid mounting sensor on metal or in an area with large quantities of metal or electrical wiring as this can cause signaling issues.
